

Here's a summary of the interview:

****Big O Notation****: The candidate understands Big O notation as a method to calculate time complexity, focusing on the worst-case scenario. They use an analogy of rating a recipe's cooking time to explain how the effort grows with input size.

****Strengths and Weaknesses****:

- Strength: The candidate has experience with data-driven applications and mentions working on a final-year project, showcasing their ability to work in teams and take on responsibilities.
- Weakness: They mention that they had to learn Power BI and web scraping within a month, which was a significant challenge. However, they managed to overcome this obstacle.

****Suggestions****: The candidate suggests dividing complex problems into manageable chunks to increase efficiency and accessibility. They also recommend using a hybrid approach combining different methods for cold-start scenarios when designing a personalized movie recommendation system.

****Other Points****: The candidate is excited about the role because of its focus on data-driven applications and modularity. They have experience working with tf-idf vectorizations, cosine similarity, Power BI, and Power Query.
